Malicious Software: should we care?

Information Security Group

Dr Lorenzo Cavallaro

Malicious software (malware) is the traditional way in which cybercriminals infect user and enterprise hosts to gain access to their private, financial, and intellectual property data. Once stolen, such information can enable more sophisticated attacks, generate illegal revenue, undermine users privacy, and allow for cyber-espionage. In this talk I will give an overview of information security and privacy-related threats, trying to answer the most challenging and foremost question: "Should we care?"

Moore Building

6.15 pm
20 November 2013

All welcome, admission free
The lecture will be preceded by a reception and exhibition
